# SECTION 2
# LOCAL CHECKS AND ENTRY RECORDS

SYSTEM MAP / PASS CREATION: PAGE 1 · GATE DECISION / OFFLINE RECORDS: PAGE 2

## 2.1 HOW DOES THE GATE DECIDE?

The gate first downloads event rules, public keys, and cancellations. It uses these saved items offline. Figure 3 shows the normal acceptance path.

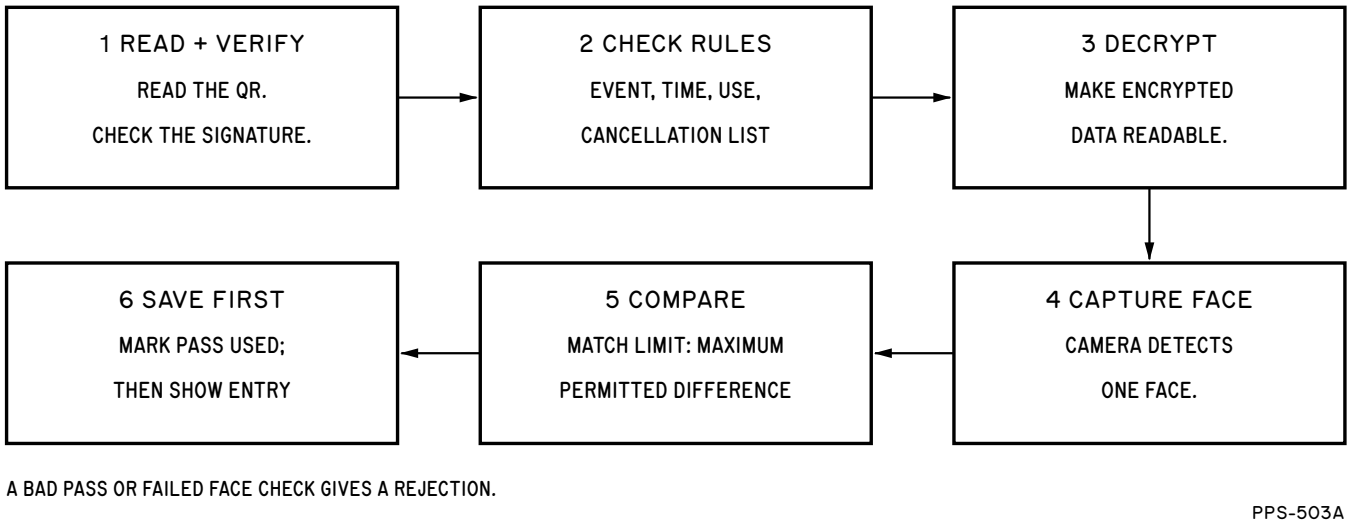

Figure 3. The Gate Checks the Pass, Then the Person

## 2.2 WHAT HAPPENS INSIDE THE FACE COMPARISON?

The gate applies the same event rule to the new face data. It counts differences between the new template and the pass template. The match limit sets the permitted difference. A small limit can reject the correct person. A large limit can accept the wrong person.

## 2.3 WHAT HAPPENS TO AN ENTRY RECORD?

The gate saves ticket use and an entry record before it shows entry approval. This stops another use on that gate. The entry record waits for a server connection (figure 4).

Figure 4. Local Storage Keeps the Record Until Reconnection

### OFFLINE LIMIT

A gate cannot receive new cancellations while offline. It can use an old cancellation list. A new download is necessary to receive the changes.

**WHAT DID I TEST OR ACHIEVE?**

A local software test rejected a second entry record for the same pass. This shows database protection against repeat records. It does not test face accuracy or fake-face protection.

Result: gate-db.test.ts, duplicate-record check; verified 28 October 2026. The architecture and normal entry path are simplified.
