SECTION 2
PASS SECURITY AND OFFLINE ENTRY

FACE WORDS / MATCH ERRORS: PAGE 1 · PASS SECURITY / OFFLINE / TEST CLAIMS: PAGE 2

2.1 SIGNED AND ENCRYPTED: WHAT IS THE DIFFERENCE?

A digital signature lets the gate examine the source of a pass and find changes to it. Encryption changes face data into a form that only a prepared gate can read. A digital signature gives no encryption. A copied pass can still have a correct digital signature. The gate must also compare the face with the pass (figure 3).

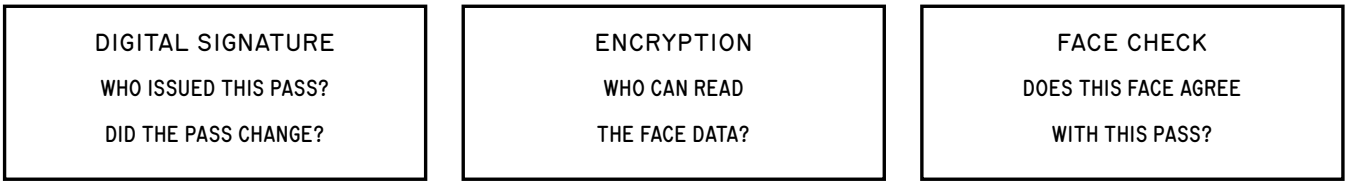

Figure 3. Each Check Answers a Different Question

2.2 HOW CAN THE GATE OPERATE OFFLINE?

Offline means no internet connection. The gate first downloads event data while it has an internet connection. It can then use the saved data for the entry decision. The server is the central computer for accounts and ticket records. The design does not keep face data here for use across different events.

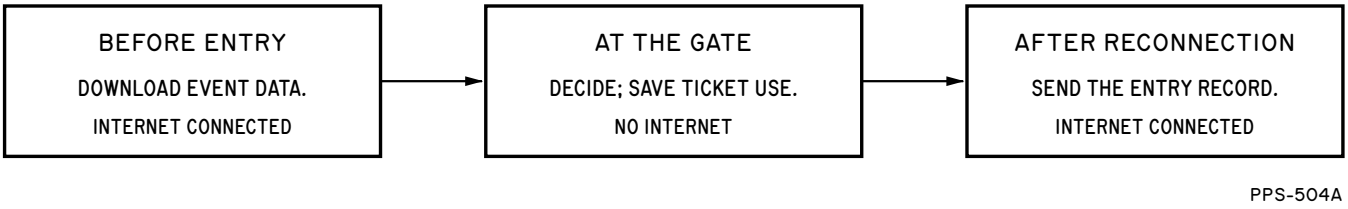

Figure 4. Offline Means Local Decisions, Then a Later Update

2.3 WHY CAN A CANCELED TICKET STILL PASS?

Example: A gate goes offline. The organizer then cancels a ticket. The gate cannot receive that change until it connects again. Offline entry uses the information already on the gate.

Table 2. How to Read a Test Claim

Phrase in the talk	What it establishes
Software test	A check of a specified part under test conditions.
Observed run	Someone saw the system operate. This alone gives no repeat test record.
Prototype	A test system. This word gives no performance result.

NOTE

A detected face can be a photo or a screen. Face detection alone does not stop a spoof attack.

EXAMINE A TEST CLAIM

```
1 Find what the test measured.
2 Find the test conditions.
3 Look for a saved test record.
4 Look for more than one test.
```

Based on PrivatePass_EPQ Presentation_v4.pptx and its speaker notes. Examples explain concepts; they are not recorded test results.
